

Motor Compensation

Nathaniel Yomogida, SPT

Chloë Kerstein, SPT

Table of contents

1 Adaptive Compensation **1**

2 Behavioral Substitution **1**

Motor compensation refers to performance of an old movement in a new manner that can be achieved through adaptive compensation or behavioral substitution¹

Motor compensation can be divided into adaptive compensation and behavioral substitution

1 Adaptive Compensation

Adaptive compensation refers to using alternative motor patterns to accomplish a task¹

i Example of Adaptive Compensation

E.g. the patient with a complete T1 SCI learns to roll using both UEs and momentum¹

2 Behavioral Substitution

Behavioral substitution refers to using alternate body segments or effectors to accomplish a task¹.

i Example of Behavioral Substitution

For example, a patient with a stroke learns to dress independently using the less affected upper extremity (UE)¹.
