Table of contents

1	Overview	1
2	Dysfunction 2.1 Excitotoxicity caused neurodegeneration	1
3	Related pathologies 3.1 Amyotrophic Lateral Sclerosis	1
1	Overview	
	• Glutamate is an excitatory neurotransmitter 1	

2 Dysfunction

2.1 Excitotoxicity caused neurodegeneration

 $\bullet\,$ Excess glutamate triggers a cascade of events leading to cell death 1

3 Related pathologies

3.1 Amyotrophic Lateral Sclerosis

• Amyotrophic lateral sclerosis via excitotoxicity

- Increased levels of glutamate in the cerebrospinal fluid (CSF), plasma, and in postmortem tissue of individuals with ALS have been reported¹
- Researchers attribute a deficiency in excitatory amino acid transporter 2 (EAAT2) in the motor cortex and spinal cord of postmortem ALS tissue was reported and lends support to the theory of excitotoxicity causing neurodegeneration.
